

Cybersecurity Incident Registry

Application version 0.6.0-31 - Container-ready operational registry for cyber incidents, workflows, notifications, audit evidence and documentation.

Purpose

Cybersecurity Incident Registry supports the end-to-end management of cybersecurity incidents: initial registration, classification, action tracking, notifications, evidence, PDF documents, audits, reports and closure.

The solution helps keep evidence, timings, responsibilities and communications in one operational registry suitable for internal checks, audits and accountability.

The screenshot shows the main dashboard of the Cybersecurity Incident Registry. At the top is a navigation bar with links: Incidenti, Export, Report, Moduli, Admin, and Aiuto. Below the navigation bar is a header section with the text "Pagina principale: elenco incidenti, ricerca e avvisi procedurali" and a green button labeled "Nuovo incidente". Below this is a table with the following data:

△	Nome incidente	Gravità	Stato	Durata	Azioni
△	Phishing credenziali	Alta	Aperto	2h 15m	Dettaglio PDF
	Malware endpoint	Media	Chiuso	1g 4h	Dettaglio
	Errore invio dati	Bassa	Aperto	35m	Dettaglio

Example of the operational interface for monitoring and managing incidents.

Key features

- Incident registry with statuses, severity, categories, affected data, consequences and operational recommendations.
- Docker container distribution: public Docker Hub image `desalvo/cybersecurity-incident-registry`.
- Integration with multiple authentication mechanisms: local accounts, LDAP/Active Directory, SSO OAuth2/OpenID Connect and MFA.
- Full configurability of actions, workflow steps, taxonomies, notifications, templates, logos, roles and operational options.
- Supported deployment with Docker Compose and Kubernetes manifests for repeatable and scalable installations.
- Accessible desktop and mobile interface for both workstation and on-the-go operations.
- Configurable automatic notifications to users, CSIRT, DPO and custom recipients, with automatic attachments of generated or filled documents.
- Import of external custom workflows with duplicate detection for already existing elements.
- Modular analysis and configuration for automatic completion of fillable PDF forms.
- Compliance with AGID secure-software guidelines, with dynamic tests periodically executed for each new release.
- Italian + English localization for interface, documentation and main messages.
- Optional AI chatbot knowledge base for AlBot/Alex with anonymized data; European Union Public Licence (EUPL).

Governance, automation and traceability

Flusso operativo consigliato

Guided workflows

Configurable actions and steps guide each incident from detection to closure.

Dettaglio incidente: avvisi, timeline, documenti, notifiche e moduli

Scheda principale

Gravità: Alta
Categorie: phishing, credenziali
Numero interessati: 42
Volume dati: credenziali account
Raccomandazioni selezionate: 3

Avvisi procedurali

⚠ Notifica all'utente richiesta non ancora registrata

Azioni effettuate

- Informazione iniziale - segnalazione SOC esportabile: si
- Analisi header e link malevolo esportabile: si
- Reset password e revoca sessioni esportabile: si
- Notifica all'utente esportabile: no

Timeline and evidence

Chronology, attachments, recipients, documents and structured fields remain available in a single view.

Configurazione moduli PDF: mapping campi e sostituzione template

Campi database incidenti

Descrizione e causa
Numero di interessati
Volume dati
measures_adopted
Motivi non garantiti
Luogo documentazione

Campi PDF e mapping salvati

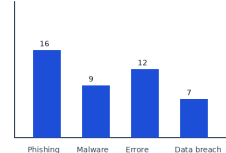

field_1 → Descrizione e causa
field_2 → Numero di interessati
field_3 → measures_adopted
field_4 → Luogo
Sostituisci PDF

PDF forms

Field mapping and automatic completion of fillable PDF documents from incident data.

Esempi di grafici disponibili nella reportistica

Incidenti per categoria

Distribuzione gravità

Reporting

Charts and reports help monitor volumes, states, severity and response times.

Docker Hub

Docker Compose

Kubernetes

AGID audit

Main outputs

PDF reports, filled forms, CSV audits, full backups, documentary evidence, data export/import, importable external workflows and Docker/Docker Compose/Kubernetes deployment.
